GONGIDI KAVYA SREE

Computer Science (AIML) Student | gongidikavyasree@gmail.com | +918688202722

SUMMARY

Computer Science (AIML) undergraduate with hands-on experience building intelligent applications — from research workflows and deep learning models to full-stack web platforms. Passionate about solving real-world problems in healthcare, education, and child safety through AI-driven systems. Looking for opportunities to contribute to production-level systems and grow through collaborative software engineering.

EDUCATION

B.Tech in Computer Science & Engineering (AIML)
Keshav Memorial Engineering College | 2023–2027 | GPA: 8.6

Intermediate (MPC)
Sri Prathiba Junior College | 2021–2023 | GPA: 9.6

Secondary School Certificate (SSC)
St. Francis De Sales High School | 2021 | GPA: 9.8

TECHNICAL SKILLS

- **Programming Languages:** Python, JavaScript, Java
- **Core Computer Science:** Data Structures and Algorithms, Object-Oriented Programming (OOP), Operating Systems (OS), Computer Networks (CN)
- **Databases:** SQL, MongoDB
- **AI / ML & Deep Learning:** Machine Learning, Deep Learning (LSTM, CNN/Conv1D), Computer Vision (SegFormer, ViT)
- **Generative AI:** LLM APIs (Gemini), Prompt Engineering, Agentic Workflows, RAG Pipelines, Explainable AI (Grad-CAM++, Integrated Gradients, Attention)
- **Web Development:** HTML, CSS, React.js, Node.js, Express.js, Flask, REST APIs
- **Data & Visualization:** Pandas, NumPy, Matplotlib
- **Tools & Platforms:** Git, GitHub, Jupyter Notebook, Google Colab, Kaggle
- **Soft Skills:** Communication, Teamwork, Problem-Solving, Adaptability, Time Management, Willingness to Learn

EXPERIENCE

1. Research Assistant — Explainable AI for Brain Tumor Detection

Under the guidance of an Assistant Professor at Keshav Memorial Engineering College (KMEC)

Worked as a Research Assistant on an Explainable AI system for brain tumor diagnosis from MRI scans. Built a dual-pipeline model combining tumor segmentation (SegFormer B3) and classification (ViT-Small) to localize and identify tumor regions. Applied XAI techniques — native attention, Integrated Gradients, and Grad-CAM++ — to generate visual explanations revealing which regions of an MRI influenced each prediction, making the model's decisions interpretable for clinical validation.

2. Participant — AI Emergency Medical Support System | VMTW Hackathon

Built an AI-powered emergency alert system enabling anyone to notify nearby hospitals during an emergency — even without unlocking a phone, a single press sends the request. The workflow routes alerts to the nearest available hospitals and automatically notifies the user's emergency contacts via SMS with their condition and location, while an integrated AI assistant guides users through critical situations until help arrives.

3. Participant — Mental Wellness AI Solution | Gen AI Exchange Hackathon

Developed an AI-powered mental wellness solution helping youth overcome stigma and access support confidentially. The system delivers empathetic, judgment-free conversational guidance and directs users toward appropriate mental health resources, with a privacy-first design ensuring sensitive conversations remain confidential.

4. Participant — Child Safety Content Filtering System | Hack With India

Designed a child-safety system that uses an on-device AI content classifier to screen web pages in real time and block age-inappropriate content before it loads. The architecture replaces blocked pages with a safe notice and logs flagged attempts for parental review, closing the gap between standard parental controls and unrestricted browsing.

PROJECTS

1. ResearchMind AI — Agentic Research Workflow

Architected an agentic AI research workflow that routes each query to dynamically selected agents from a pool of six reusable agents. Research results are stored in a RAG pipeline so similar queries reuse existing findings, reducing redundant computation, with automated freshness checks that remove outdated data — supporting multi-domain, user-selectable research.

2. CodeViz — Code Visualization Platform for Students

Built an educational platform where students write code and watch it execute through line-by-line visual animations. AI detects the data structures used in the submitted code and generates matching visualizations automatically, with time and space complexity behavior illustrated during execution to make abstract concepts concrete.

3. AI Quiz Generator — Personalized Learning Platform

Engineered an AI-powered learning platform that converts PDFs, prompts, or topics into customized quizzes with configurable question count, difficulty, and format (MCQ, fill-in-the-blanks, true/false). Questions are generated using Bloom's Taxonomy, supported by pre-quiz topic summaries and per-question explanations of why an answer is correct. Includes an AI-assisted editor to modify or add questions via prompts, plus post-quiz performance tracking for personalized learning.

4. Blood Donation Network — Full-Stack Web Platform

Designed and developed a full-stack MERN platform connecting blood donors with seekers through location and blood group-based search. Donors register their details once, and seekers can instantly find and contact matching donors in their area, enabling a direct and fast donor-to-seeker connection.

5. Stock Price Prediction using Deep Learning

Built a hybrid deep learning model (LSTM + Conv1D) to predict next-day stock prices using Yahoo Finance API data, where LSTM captures long-term trends and CNN extracts short-term price patterns. Achieved 76% directional accuracy — correctly predicting whether the next day's price rises or falls — evaluated using MSE, RMSE, and MAE metrics.
